Appendix I: Managed Area Species Richness

SEACAR Coastal Wetlands Analysis: Species Richness

Last compiled on 21 July, 2023

Important Notes

The purpose of this script is to determine species richness by species group, create managed area statistics, generate summary plots, and create reports in pdf and Word document form for Coastal Wetlands data.

These scripts were created by J.E. Panzik (mailto:jepanzik@usf.edu) (jepanzik@usf.edu (mailto:jepanzik@usf.edu)) for SEACAR.

All scripts and outputs can be found on the SEACAR GitHub repository:

https://github.com/FloridaSEACAR/SEACAR_Trend_Analyses (https://github.com/FloridaSEACAR/SEACAR_Trend_Analyses)

This markdown file is designed to be compiled by CoastalWetlands_SpeciesRichness_ReportRender.R
(https://github.com/FloridaSEACAR/SEACAR_Trend_Analyses/blob/main/Coastal_Wetlands/CoastalWetlands_SpeciesRichness_ReportRender.R)
(https://github.com/FloridaSEACAR/SEACAR_Trend_Analyses/blob/main/Coastal_Wetlands/CoastalWetlands_SpeciesRichness_ReportRender.R)
(https://github.com/FloridaSEACAR/SEACAR_Trend_Analyses/blob/main/Coastal_Wetlands/CoastalWetlands_SpeciesRichness_ReportRender.R)).

Libraries and Settings

Loads libraries used in the script. The inclusion of `scipen` option limits how frequently R defaults to scientific notation. Sets default settings for displaying warning and messages in created document, and sets figure dpi.

```
library(knitr)
library(data.table)
library(dplyr)
library(lubridate)
library(ggplot2)
library(scales)
library(tidyr)
library(gridExtra)
#library(tidyverse)
library(ggpubr)
library(scales)
options(scipen=999)
knitr::opts_chunk$set(
  warning=FALSE,
  message=FALSE,
  dpi=200
)
```

File Import

Imports file that is determined in the SEACAR_CoastalWetlands_SpeciesRichness_ReportRender.R script.

The command `fread` is used because of its improved speed while handling large data files. Only columns that are used by the script are imported from the file, and are designated in the `select` input.

The script then gets the name of the parameter as it appears in the data file and units of the parameter.

The latest version of Coastal Wetlands data is available at: <https://usf.box.com/s/jpws8kram54xt6zma5wo9mqferddcn>
(<https://usf.box.com/s/jpws8kram54xt6zma5wo9mqferddcn>)

The file being used for the analysis is: **All_CW_Parameters-2023-Jun-05.txt**

```
#Import data from coastal wetlands file
data <- fread(file_in, sep="|", header=TRUE, stringsAsFactors=FALSE,
              na.strings=c("NULL", "", "NA"))

cat(paste("The data file used is:", file_short, sep="\n"))
```

```
## The data file used is:
## All_CW_Parameters-2023-Jun-05.txt
```

Data Filtering

The processing and filtering that is done to the data is as follows:

1. Only take data rows that are percent cover
2. Only keep data rows that are Marsh, Marsh succulents, and Mangroves and associate
3. Set parameter names to Species Richness
4. Sets units
5. Removes rows that contains NA values in ManagedAreaName, GenusName, SpeciesName, Month, Year, SpeciesGroup1, and removes invasive species data
6. Sets ResultValue to be numeric values and removes rows where percent cover is 0
7. Removes duplicates (MADup ==1)
8. Combines genus and species names
9. Corrects some managed area names to match what is being used with other habitats
10. Creates species richness dataset
 - Grouped based on common ManagedAreaName, ProgramID, ProgramName, ProgramLocationID, and SampleDate
 - SpeciesRichness determined based on the number of unique species (gensp) in each group
11. Merges data with managed area data to determine correct AreaID
12. Writes to file with “_UsedData” file name to indicate what data was used for species richness.

```

# Only interested in Percent Cover measurements
data <- data[data$ParameterName=="Percent Cover - Species Composition"]
# Make species group name uniform
data$SpeciesGroup1[data$SpeciesGroup1=="Marsh Succulents"] <- "Marsh succulents"
# Only keep data rows that are Marsh, Marsh succulents, and Mangroves and assoc.
data <- data[SpeciesGroup1=="Marsh"|
             SpeciesGroup1=="Marsh succulents"|
             SpeciesGroup1=="Mangroves and associate", ]
setnames(data, "SpeciesGroup1", "SpeciesGroup")
# Create ParameterName Column
data$ParameterName <- "Species Richness"
parameter <- "Species Richness"

# Sets units for species richness
unit <- "# of species"
data$ParameterUnits <- unit

# Replace instances where NA values imported as blank character string or as "NA"

# Puts the managed areas in alphabetical order
MA_Include <- MA_Include[order(MA_Include)]

# Determines the number of managed areas used
n <- length(MA_Include)

```

Managed Area Statistics

Gets summary statistics for each managed area. Uses piping from dplyr package to feed into subsequent steps. The following steps are performed:

- Group data that have the same `ManagedAreaName`, `Year`, `Month`, and `SpeciesGroup`.
 - Second summary statistics do not use the `Month` grouping and are only for `ManagedAreaName`, `Year`, and `SpeciesGroup`.
 - Third summary statistics do not use `Year` grouping and are only for `ManagedAreaName`, `Month`, and `SpeciesGroup`.
 - Fourth summary statistics are only grouped based on `ManagedAreaName` and `SpeciesGroup`.
 - Determines the years that the minimum and maximum species richness occurred
- For each group, provide the following information: Parameter Name (`ParameterName`), Number of Entries (`N_Data`), Lowest Value (Min), Largest Value (Max), Median, Mean, Standard Deviation, and a list of all Programs included in these measurements.
- Sort the data in ascending (A to Z and 0 to 9) order based on `ManagedAreaName` then `Year` then `Month`
- Write summary stats to a pipe-delimited `.txt` file in the output directory

Appendix I: Managed Area Species Richness

The plots shown here are the species richness for each managed area with a yearly average.

1. Set common plot theme.
2. Determine the earliest and latest year of the data to create x-axis scale and intervals
3. Determine the upper and lower limit of the plot for better y-axis labels
4. Determines what species groups are present and adjusts legend entries
5. Add the plot line
6. Set the plot type as a point plot with the size of the points
7. Create the title, x-axis, y-axis, and color fill labels
8. Set the y and x limits
9. Apply common plot theme
10. Add table with summary statistics below each figure
 - Numerical non-integer values are rounded to 2 decimal places
 - StandardDeviation is renamed StDev for space reasons
11. Create file name to save figure
12. Save figure as png file
