Linera Mixed Effects Models	6
Appendix I: Plots	7

Important Notes

These scripts were created by J.E. Panzik (jepanzik@usf.edu) for SEACAR.

All scripts and outputs can be found on the SEACAR GitHub repository:

https://github.com/FloridaSEACAR/SEACAR_Trend_Analyses

This markdown file is designed to be compiled by SEACAR_Coral_PercentCover_ReportRender.R (https://github.com/FloridaSEACAR/SEACAR_Trend_Analyses/blob/main/Coral/SEACAR_Coral_PercentCover_ReportRender.R).

Libraries and Settings

Loads libraries used in the script. The inclusion of scipen option limits how frequently R defaults to scientific notation. Sets default settings for displaying warning and messages in created document, and sets figure dpi.

library(knitr)
library(data.table)
library(dplyr)
library(lubridate)
library(ggplot2)
library(scales)

```
library(tidyr)
library(gridExtra)
#library(tidyverse)
library(hrbrthemes)
library(nlme)
library(ggpubr)
options(scipen=999)
opts_chunk$set(warning=FALSE, message=FALSE, dpi=200)
```

File Import

Imports file that is determined in the SEACAR_Coral_PercentCover_ReportRender.R script.

The command fread is used because of its improved speed while handling large data files. Only columns that are used by the script are imported from the file, and are designated in the select input.

The script then gets the name of the parameter as it appears in the data file and units of the parameter.

The latest version of Coral data is available at: https://usf.box.com/s/8hyj2ur5arothlifg1isnq2gxisjzbdg

The file(s) being used for the analysis: All_CORAL_Parameters-2023-Jun-05.txt

Data Filtering

The processing and filtering that is done to the data is as follows:

- 1. Only take data rows that are Percent Cover measurements
- 2. Shorten parameter names to Percent Cover
- 3. Sets units
- 4. Removes any data that is not coral
- Only looks for Octocoral or Unspecifiedcoral
- 5. Removes rows that contains NA values in ManagedAreaName, GenusName, SpeciesName, Month, Year, SpeciesGroup1, ResultValue, and SampleDate
- 6. Removes duplicates (MADup==1)
- 7. Combines genus and species names
- 8. Corrects some managed area names to match what is being used with other habitats
- 9. Merges data with managed area data to determine correct AreaID
- 10. Gets list of managed areas to be analyzed.

```
# Only keep data for Percent Cover
data <- data[data$ParameterName=="Percent Cover - Species Composition"]</pre>
# Simplify ParametetrNamee to Percent Cover
data$ParameterName <- "Percent Cover"</pre>
parameter <- "Percent Cover"</pre>
# Sets units for species richness
unit <- "%"
data$ParameterUnits <- unit</pre>
# Remove any rows that are not corals
data <- data[SpeciesGroup1=="Octocoral"|SpeciesGroup1=="Milleporans"|</pre>
               SpeciesGroup1=="Scleractinian", ]
# Remove rows with missing ManagedAreaName
data <- data[!is.na(data$ManagedAreaName),]</pre>
data <- data[data$ManagedAreaName!="NA",]</pre>
# Remove rows with missing GenusName
data <- data[!is.na(data$GenusName),]</pre>
# Remove rows with missing SpeciesName
data <- data[!is.na(data$SpeciesName),]</pre>
# Remove rows with missing Months

# Adds AreaID for each managed area by combining the MA_All datatable to the
# data based on ManagedAreaName
data <- merge.data.frame(MA_All[,c("AreaID", "ManagedAreaName")],</pre>
                           data, by=c("AreaID", "ManagedAreaName"), all=TRUE)
# Creates a variable with the names of all the managed areas that contain
# species observations
```

```
MA_Include <- unique(data$ManagedAreaName[!is.na(data$ResultValue)])

# Puts the managed areas in alphabetical order

MA_Include <- MA_Include[order(MA_Include)]

# Determines the number of managed areas used

n <- length(MA_Include)
```

Managed Area Statistics

Gets summary statistics for each managed area. Uses piping from dplyr package to feed into subsequent steps. The following steps are performed:

- 1. Group data that have the same ManagedAreaName, Year, and Month.
 - Second summary statistics do not use the Month grouping and are only for ManagedAreaName and Year.
 - Third summary statistics do not use Year grouping and are only for ManagedAreaName and Month
 - Fourth summary statistics are only grouped based on ManagedAreaName
- 2. For each group, provide the following information: Parameter Name (ParameterName), Number of Entries (N_Data), Lowest Value (Min), Largest Value (Max), Median, Mean, Standard Deviation, and a list of all Programs included in these measurements.
- 3. Sort the data in ascending (A to Z and 0 to 9) order based on ManagedAreaName then Year then Month
- 4. Write summary stats to a pipe-delimited .txt file in the output directory
 - Coral Percent Cover Output Files in SEACAR GitHub (https://github.com/FloridaSEACAR/SEACAR_Trend_Analyses/tree/main/Coral/output/PercentCover)

```
# Create summary statistics for each managed area based on Year and Month
# intervals.
MA_YM_Stats <- data %>%
  group_by(AreaID, ManagedAreaName, Year, Month) %>%

```

Linera Mixed Effects Models

Performs a linear mixed effects (LME) model on each managed area between using a relationship between percent cover and year.

The following steps are performed:

- 1. Create a blank data frame to store results
- 2. Sets the column names for the data to be stored from LME model
- 3. Starts a loop for each managed area included in the analysis
- 4. Gets data for the current managed area
- 5. Performs LME on current managed area
- 6. Stores information and fits into line stats data frame for current managed area
- 7. Merges lme_stats with MA_Ov_Stats to create a data frame with gegneral statistics and the LME parameters
- 8. Puts lme_stats in alphabetical order by managed area name
- 9. Write lme_stats to a pipe-delimited .txt file in the output directory
 - Coral Percent Cover Output Files in SEACAR GitHub (https://github.com/FloridaSEACAR/SEACAR_Trend_Analyses/tree/main/Coral/output/PercentCover)
- 10. Gets the start and endpoints for LME fit to be used in plots.

```
lme_data <- data[data$ManagedAreaName==MA_Include[i],]</pre>
  # Perform LME for relation between ResultValue and Year for current managed area
  AnyCoral <- lme (Result Value ~ Year,
                random =~1|ProgramLocationID,
                na.action = na.omit,
                data = lme_data)
  # Store information and model fits in appropriate row of data frame
  lme stats$AreaID[i] <- unique(lme data$AreaID)</pre>
  lme stats$ManagedAreaName[i] <- MA Include[i]</pre>
  lme_stats$LME_Intercept[i] <- AnyCoral$coefficients$fixed[1]</pre>
  lme_stats$LME_Slope[i] <- AnyCoral$coefficients$fixed[2]</pre>
  # Clears temporary variables for memory
 rm(lme data)
  rm(AnyCoral)
# Merges LME stats with overall stats to complete stats for each managed area
lme_stats <- merge.data.frame(MA_Ov_Stats[,-c("Programs", "ProgramIDs")],</pre>
                               lme_stats, by=c("AreaID", "ManagedAreaName"), all=TRUE)
# Puts the data in order based on ManagedAreaName
lme_stats <- as.data.frame(lme_stats[order(lme_stats$ManagedAreaName), ])</pre>
# Write lme statistics to file
fwrite(lme_stats, paste0(out_dir,"/Coral_", param_file,
                            " LME Stats.txt"), sep="|")
# Gets lower x and y values based on LME fit to use in plot
lme_plot <- lme_stats %>%
   group_by(AreaID, ManagedAreaName) %>%
   summarize(x=EarliestYear,
             y=LME_Slope*x+LME_Intercept)
# Gets upper x and y values based on LME fit to use in plot
lme_plot2 <- lme_stats %>%
   group_by(AreaID, ManagedAreaName) %>%
   summarize(x=LatestYear,

lme_plot <- lme_plot[!is.na(lme_plot$y),]</pre>
```

Appendix I: Plots

The plots shown here are the percent cover for each managed area by year with the LME trendline.

- 1. Set common plot theme.
- 2. Starts a loops that creates plots for each managed area analyzed
- 3. Determine the earliest and latest year of the data to create x-axis scale and intervals

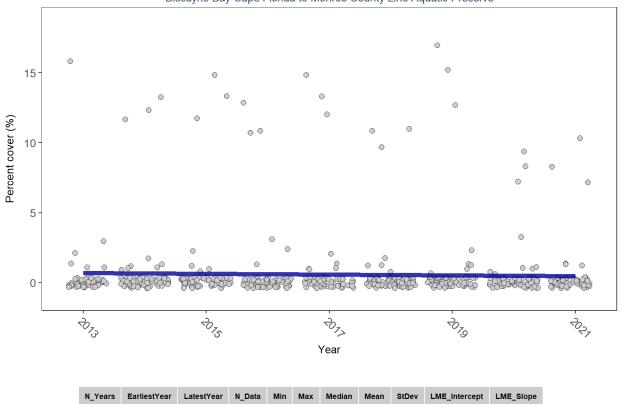

- 4. Determine the upper and lower limit of the plot for better y-axis labels
- 5. Set the plot type as a jitter plot with the size of the points to show concentration of data
- 6. Add LME trendline
- 7. Create the title, x-axis, y-axis
- 8. Set the y and x limits
- 9. Apply common plot theme
- 10. Add table with summary statistics below each figure
 - Numerical non-integer values are rounded to 2 decimal places
 - StandardDeviation is renamed StDev for space reasons
- 11. Create file name to save figure
- 12. Save figure as png file
 - Coral Percent Cover Figures in SEACAR GitHub (https://github.com/FloridaSEACAR/SEACAR_Trend_Analyses/tree/main/Coral/output/PercentCover/Figures)

```
# Defines standard plot theme: black and white, no major or minor grid lines,
# Arial font. Title is centered, size 12, and blue (hex coded). Subtitle is
# centered, size 10, and blue (hex coded). Legend title is size 10 and the
# legend is left-justified. X-axis title is size 10 and the margins are padded
# at the top and bottom to give more space for angled axis labels. Y-axis title
# is size 10 and margins are padded on the right side to give more space for
\# axis labels. Axis labels are size 10 and the x-axis labels are rotated -45
# degrees with a horizontal justification that aligns them with the tick mark
plot theme <- theme bw() +
